

UNIVERSITY OF MUMBAI

Teacher's Reference Manual

Subject: Business Intelligence
Practical

with effect from the academic year

2018 – 2019

Business Intelligence LAB Manual

Note: This Manual is just a reference manual for conducting the practical in laboratory. The respective tutors/teachers are supposed to conduct the practical with necessary modifications.

Practical 1: Import the legacy data from different sources such as (Excel, SqlServer, Oracle etc.) and load in the target system.

Importing Excel Data

- 1) Launch Power BI Desktop.
- 2) From the Home ribbon, select Get Data. Excel is one of the Most Common data connections, so you can select it directly from the Get Data menu.

- 3) If you select the Get Data button directly, you can also select File > Excel and select Connect.
- 4) In the Open File dialog box, select the Products.xlsx file.
- 5) In the Navigator pane, select the Products table and then select Edit.

Business Intelligence LAB Manual

Importing Data from OData Feed

In this task, you'll bring in order data. This step represents connecting to a sales system. You import data into Power BI Desktop from the sample Northwind OData feed at the following URL, which you can copy (and then paste) in the steps below: <http://services.odata.org/V3/Northwind/Northwind.svc/>

Connect to an OData feed:

- 1) From the Home ribbon tab in Query Editor, select Get Data.
 - 2) Browse to the OData Feed data source.
 - 3) In the OData Feed dialog box, paste the URL for the Northwind OData feed.
 - 4) Select OK.
-
- 5) In the Navigator pane, select the Orders table, and then select Edit.

Business Intelligence LAB Manual

The screenshot shows a 'Navigator' window with a tree view of tables from a Northwind database. The 'Orders' table is selected, and its preview is displayed in a grid. The grid contains columns: OrderID, CustomerID, EmployeeID, OrderDate, and RequiredDate. The data shows various orders placed between July and August 1996.

OrderID	CustomerID	EmployeeID	OrderDate	RequiredDate
10248	VINET	5	7/4/1996 12:00:00 AM	8/1/1996
10249	TOMSP	6	7/5/1996 12:00:00 AM	8/16/1996
10250	HANAR	4	7/8/1996 12:00:00 AM	8/5/1996
10251	VICITE	3	7/8/1996 12:00:00 AM	8/5/1996
10252	SUPRO	4	7/9/1996 12:00:00 AM	8/6/1996
10253	HANAR	5	7/10/1996 12:00:00 AM	7/24/1996
10254	CHOPS	5	7/11/1996 12:00:00 AM	8/8/1996
10255	RICSU	9	7/12/1996 12:00:00 AM	8/8/1996
10256	WELLU	3	7/15/1996 12:00:00 AM	8/12/1996
10257	HILAA	4	7/16/1996 12:00:00 AM	8/13/1996
10258	ERNSH	1	7/17/1996 12:00:00 AM	8/14/1996
10259	CENTC	4	7/18/1996 12:00:00 AM	8/15/1996
10260	OTTIK	4	7/19/1996 12:00:00 AM	8/16/1996
10261	QUEDDE	4	7/19/1996 12:00:00 AM	8/16/1996
10262	RATTG	8	7/21/1996 12:00:00 AM	8/18/1996
10263	ERNSH	9	7/23/1996 12:00:00 AM	8/20/1996
10264	POLKO	5	7/24/1996 12:00:00 AM	8/21/1996
10265	BLOTP	2	7/25/1996 12:00:00 AM	8/22/1996
10266	WARTH	3	7/26/1996 12:00:00 AM	8/6/1996
10267	FRANK	4	7/29/1996 12:00:00 AM	8/26/1996
10268	GROSR	8	7/30/1996 12:00:00 AM	8/27/1996
10269	WHITC	5	7/31/1996 12:00:00 AM	8/14/1996
10270	WARTH	1	8/1/1996 12:00:00 AM	8/28/1996

Note - You can click a table name, without selecting the checkbox, to see a preview.

Practical 2: Perform the Extraction Transformation and Loading (ETL) process to construct the database in the Sqlserver / Power BI.

Step 1 : Data Extraction :

The data extraction is first step of ETL. There are 2 Types of Data Extraction

1. Full Extraction : All the data from source systems or operational systems gets extracted to staging area. (Initial Load)
2. Partial Extraction : Sometimes we get notification from the source system to update specific date. It is called as Delta load.

Source System Performance: The Extraction strategies should not affect source system performance.

Step 2 : Data Transformation :

The data transformation is second step. After extracting the data there is big need to do the transformation as per the target system. I would like to give you some bullet points of Data Transformation.

- Data Extracted from source system is in to Raw format. We need to transform it before loading in to target server.
- Data has to be cleaned, mapped and transformed

Business Intelligence LAB Manual

- There are following important steps of Data Transformation :

1.Selection : Select data to load in target

2.Matching : Match the data with target system

3.Data Transforming : We need to change data as per target table structures

Real life examples of Data Transformation :

- Standardizing data : Data is fetched from multiple sources so it needs to be standardized as per the target system.
- Character set conversion : Need to transform the character sets as per the target systems. (Firstname and last name example)
- Calculated and derived values: In source system there is first val and second val and in target we need the calculation of first val and second val.
- Data Conversion in different formats : If in source system date is in DDMMYY format and in target the date is in DDMONYYYY format then this transformation needs to be done at transformation phase.

Step 3 : Data Loading

Following are the steps to open BIDS\SSDT.

Step 1 – Open either BIDS\SSDT based on the version from the Microsoft SQL Server programs group. The following screen appears.

Step 2 – The above screen shows SSDT has opened. Go to file at the top left corner in the above image and click New. Select project and the following screen opens.

Business Intelligence LAB Manual

Step 3 – Select Integration Services under Business Intelligence on the top left corner in the above screen to get the following screen.

Step 4 – In the above screen, select either Integration Services Project or Integration Services Import Project Wizard based on your requirement to develop\create the package.

Modes

There are two modes – Native Mode (SQL Server Mode) and Share Point Mode.

Models

There are two models – Tabular Model (For Team and Personal Analysis) and Multi Dimensions Model (For Corporate Analysis).

Business Intelligence LAB Manual

The BIDS (Business Intelligence Studio till 2008 R2) and SSDT (SQL Server Data Tools from 2012) are environments to work with SSAS.

Step 1 – Open either BIDS\SSDT based on the version from the Microsoft SQL Server programs group. The following screen will appear.

Step 2 – The above screen shows SSDT has opened. Go to file on the top left corner in the above image and click New. Select project and the following screen opens.

Step 3 – Select Analysis Services in the above screen under Business Intelligence as seen on the top left corner. The following screen pops up.

Business Intelligence LAB Manual

Step 4 – In the above screen, select any one option from the listed five options based on your requirement to work with Analysis services.

ETL Process in Power BI

- 1) Remove other columns to only display columns of interest

In this step you remove all columns except **ProductID**, **ProductName**, **UnitsInStock**, and **QuantityPerUnit**

Power BI Desktop includes Query Editor, which is where you shape and transform your data connections. Query Editor opens automatically when you select **Edit** from Navigator. You can also open the Query Editor by selecting **Edit Queries** from the Home ribbon in Power BI Desktop. The following steps are performed in Query Editor.

1. In **Query Editor**, select the **ProductID**, **ProductName**, **QuantityPerUnit**, and **UnitsInStock** columns (use **Ctrl+Click** to select more than one column, or **Shift+Click** to select columns that are beside each other).
2. Select **Remove Columns > Remove Other Columns** from the ribbon, or right-click on a column header and click **Remove Other Columns**.

Business Intelligence LAB Manual

3. Change the data type of the UnitsInStock column

When Query Editor connects to data, it reviews each field and to determine the best data type. For the Excel workbook, products in stock will always be a whole number, so in this step you confirm the **UnitsInStock** column's datatype is Whole Number.

1. Select the **UnitsInStock** column.
2. Select the **Data Type** drop-down button in the **Home** ribbon.
3. If not already a Whole Number, select **Whole Number** for data type from the drop down (the Data Type: button also displays the data type for the current selection).

3. Expand the Order_Details table

The Orders table contains a reference to a Details table, which contains the individual products that were included in each Order. When you connect to data sources with multiples tables (such as a relational database) you can use these references to build up your query

Business Intelligence LAB Manual

In this step, you expand the **Order_Details** table that is related to the Orders table, to combine the **ProductID**, **UnitPrice**, and **Quantity** columns from **Order_Details** into the **Orders** table. This is a representation of the data in these tables:

The Expand operation combines columns from a related table into a subject table. When the query runs, rows from the related table (**Order_Details**) are combined into rows from the subject table (**Orders**).

After you expand the Order_Details table, three new columns and additional rows are added to the Orders table, one for each row in the nested or related table.

1. In the Query View, scroll to the Order_Details column.
2. In the Order_Details column, select the expand icon ().
3. In the Expand drop-down:
 - a. Select (Select All Columns) to clear all columns.
 - b. Select ProductID, UnitPrice, and Quantity.
 - c. Click OK.

4. Calculate the line total for each Order_Details row

Power BI Desktop lets you create calculations based on the columns you are importing, so you can enrich the data that you connect to. In this step, you create a Custom Column to calculate the line total for each Order_Details row.

Calculate the line total for each Order_Details row:

1. In the Add Column ribbon tab, click Add Custom Column.

Business Intelligence LAB Manual

2. In the Add Custom Column dialog box, in the Custom Column Formula textbox, enter [Order_Details.UnitPrice] * [Order_Details.Quantity].
3. In the New column name textbox, enter LineTotal.
4. Click OK.

5. Rename and reorder columns in the query

In this step you finish making the model easy to work with when creating reports, by renaming the final columns and changing their order.

1. In Query Editor, drag the LineTotal column to the left, after ShipCountry.

Business Intelligence LAB Manual

The screenshot shows the Power BI Query Editor interface. On the left, there are two queries: 'Products' and 'Orders'. The 'Orders' query is currently selected. In the main area, a table is displayed with columns: ShipCity, LineTotal, Order_Details.ProductID, and Order_Details.UnitPrice. A tooltip 'Table.AddColumn("Removed Other")' is visible over the 'Order_Details.' prefix in the column headers. The 'Query Settings' pane on the right shows the 'Name' as 'Orders' and the 'APPLIED STEPS' section with 'Removed Other Columns' listed. The status bar at the bottom indicates '7 COLUMNS, 999+ ROWS' and 'PREVIEW DOWNLOADED AT 9:52 AM'.

- 2.Remove the Order_Details. prefix from the Order_Details.ProductID, Order_Details.UnitPrice and Order_Details.Quantity columns, by double-clicking on each column header, and then deleting that text from the column name.

6. Combine the Products and Total Sales queries

Power BI Desktop does not require you to combine queries to report on them. Instead, you can create Relationships between datasets. These relationships can be created on any column that is common to your datasets

We have Orders and Products data that share a common 'ProductID' field, so we need to ensure there's a relationship between them in the model we're using with Power BI Desktop. Simply specify in Power BI Desktop that the columns from each table are related (i.e. columns that have the same values). Power BI Desktop works out the direction and cardinality of the relationship for you. In some cases, it will even detect the relationships automatically.

In this task, you confirm that a relationship is established in Power BI Desktop between the Products and Total Sales queries

Step 1: Confirm the relationship between Products and Total Sales

1. First, we need to load the model that we created in Query Editor into Power BI Desktop. From the Home ribbon of Query Editor, select Close & Load.

The screenshot shows the Power BI Query Editor interface. The 'File' ribbon tab is selected. A 'Close & Load' dialog box is open in the foreground, containing the text: 'Close the Query Editor window and load any pending changes to the report.' Below the dialog, the 'Orders' query is visible in the preview pane, showing data for France, Germany, Brazil, and other countries with their respective line totals.

Business Intelligence LAB Manual

- Power BI Desktop loads the data from the two queries.

- Once the data is loaded, select the Manage Relationships button Home ribbon.

- Select the New... button

- When we attempt to create the relationship, we see that one already exists! As shown in the Create Relationship dialog (by the shaded columns), the ProductsID fields in each query already have an established relationship.

Business Intelligence LAB Manual

5. Select Cancel, and then select Relationship view in Power BI Desktop.

6. We see the following, which visualizes the relationship between the queries.

Business Intelligence LAB Manual

- When you double-click the arrow on the line that connects the two queries, an Edit Relationship dialog appears.

- No need to make any changes, so we'll just select Cancel to close the Edit Relationship dialog.

Practical 3: Data Visualization from ETL Process

Power BI Desktop lets you create a variety of visualizations to gain insights from your data. You can build reports with multiple pages and each page can have multiple visuals. You can interact with your visualizations to help analyze and understand your data.

In this task, you create a report based on the data previously loaded. You use the Fields pane to select the columns from which you create the visualizations.

Step 1: Create charts showing Units in Stock by Product and Total Sales by Year

Business Intelligence LAB Manual

1. Drag UnitsInStock from the Field pane (the Fields pane is along the right of the screen) onto a blank space on the canvas. A Table visualization is created. Next, drag ProductName to the Axis box, found in the bottom half of the Visualizations pane. Then we then select Sort By > UnitsInStock using the skittles in the top right corner of the visualization.

2. Drag OrderDate to the canvas beneath the first chart, then drag LineTotal (again, from the Fields pane) onto the visual, then select Line Chart. The following visualization is created.

Business Intelligence LAB Manual

3. Next, drag ShipCountry to a space on the canvas in the top right. Because you selected a geographic field, a map was created automatically. Now drag LineTotal to the Values field; the circles on the map for each country are now relative in size to the LineTotal for orders shipped to that country.

Step 2: Interact with your report visuals to analyze further

Power BI Desktop lets you interact with visuals that cross-highlight and filter each other to uncover further trends.

1. Click on the light blue circle centered in Canada. Note how the other visuals are filtered to show Stock (ShipCountry) and Total Orders (LineTotal) just for Canada.

Business Intelligence LAB Manual

Practical 4: Creating a Cube in SQL server 2012

Creating Data Warehouse

Let us execute our T-SQL Script to create data warehouse with fact tables, dimensions and populate them with appropriate test values.

Download T-SQL script attached with this article for creation of Sales Data Warehouse or download from this article “[**Create First Data Warehouse**](#)” and run it in your SQL Server.

Follow the given steps to run the query in **SSMS** (SQL Server Management Studio).

1. Open SQL Server Management Studio 2008
2. Connect Database Engine
3. Open **New Query** editor
4. Copy paste Scripts given below in various steps in new query editor window one by one
5. To run the given SQL Script, press **F5**
6. It will create and populate “Sales_DW” database on your SQL Server

Developing an OLAP Cube

For creation of OLAP Cube in Microsoft BIDS Environment, follow the 10 easy steps given below.

Step 1: Start BIDS Environment

Click on **Start Menu** -> Microsoft SQL Server 2008 R2 -> Click **SQL Server Business Intelligence Development Studio**.

Business Intelligence LAB Manual

Step 2: Start Analysis Services Project

Click File -> New -> Project -> Business Intelligence Projects -> select Analysis Services Project -> Assign Project Name -> Click OK

Step 3: Creating New Data Source

3.1 In Solution Explorer, Right click on **Data Source** -> Click **New Data Source**

Step 3: Creating New Data Source

3.1 In Solution Explorer, Right click on **Data Source** -> Click **New Data Source**

Business Intelligence LAB Manual

3.2 Click on Next

3.3 Click on New Button

3.4 Creating New connection

1. Specify Your **SQL Server Name** where your Data Warehouse was created
2. Select Radio Button according to your **SQL Server Authentication** mode
3. Specify your **Credentials** using which you can connect to your SQL Server
4. Select database Sales_DW.
5. Click on **Test Connection** and verify for its success
6. Click **OK**.

Business Intelligence LAB Manual

3.5 Select Connection created in **Data Connections-> Click Next**

next
THE NEXT LEVEL OF EDUCATION

3.6 Select Option **Inherit**

Business Intelligence LAB Manual

3.7 Assign Data Source Name -> Click Finish

Step 4: Creating New Data Source View

4.1 In the Solution Explorer, Right Click on Data Source View -> Click on New Data Source View

Business Intelligence LAB Manual

4.2 Click Next

4.3 Select Relational Data Source we have created previously (Sales_DW)-> Click Next

4.4 First move your Fact Table to the right side to include in object list.

Business Intelligence LAB Manual

Select FactProductSales Table -> Click on Arrow Button to move the selected object to Right Pane.

4.5 Now to **add dimensions** which are **related** to your **Fact Table**, follow the given steps:

Select **Fact Table** in Right Pane (Fact product Sales) -> Click On **Add Related Tables**

4.6 It will add all associated dimensions to your Fact table as per relationship specified in your SQL DW (Sales_DW).

Click Next.

4.7 Assign Name (**SalesDW DSV**)> Click Finish

Business Intelligence LAB Manual

4.8 Now Data Source View is ready to use.

Step 5: Creating New Cube

5.1 In Solution Explorer -> Right Click on Cube-> Click New Cube

Business Intelligence LAB Manual

5.2 Click Next

5.3 Select Option Use existing Tables -> Click Next

5.4 Select Fact Table Name from Measure Group Tables (FactProductSales) -> Click Next

5.5 Choose Measures from the List which you want to place in your Cube --> Click Next

Business Intelligence LAB Manual

5.6 Select All **Dimensions** here which are associated with your Fact Table-> Click **Next**

5.7 Assign **Cube Name** (SalesAnalyticalCube) -> Click **Finish**

5.8 Now your Cube is ready, you can see the newly created cube and dimensions added in your solution explorer.

Business Intelligence LAB Manual

Step 6: Dimension Modification

In Solution Explorer, double click on dimension **Dim Product** -> Drag and Drop Product Name from Table in Data Source View and Add in Attribute Pane at left side.

next
E V E L O F E D U C A T I O N

Step 7: Creating Attribute Hierarchy In Date Dimension

Double click On **Dim Date** dimension -> Drag and Drop Fields from Table shown in Data Source View to Attributes-> Drag and Drop attributes from leftmost pane of attributes to middle pane of Hierarchy.

Drag fields in sequence from Attributes to Hierarchy window (Year, Quarter Name, Month Name, Week of the Month, Full Date UK),

Business Intelligence LAB Manual

Step 8: Deploy the Cube

8.1 In Solution Explorer, right click on Project Name (SalesDataAnalysis) --> Click Properties

8.2 Set Deployment Properties First

Business Intelligence LAB Manual

In Configuration Properties, Select Deployment-> Assign Your SQL Server Instance Name Where Analysis Services Is Installed (*mubin-pc\fairy*) (*Machine Name\Instance Name*) -> Choose Deployment Mode **Deploy All** as of now ->Select Processing Option **Do Not Process** -> Click **OK**

8.3 In Solution Explorer, right click on **Project Name** (SalesDataAnalysis) -- > Click **Deploy**

8.4 Once Deployment will finish, you can see the message **Deployment Completed** in deployment Properties.

Business Intelligence LAB Manual

Step 9: Process the Cube

9.1 In Solution Explorer, right click on Project Name (SalesDataAnalysis) --> Click **Process**

9.2 Click on **Run** button to process the Cube

Business Intelligence LAB Manual

9.3 Once processing is complete, you can see **Status** as **Process Succeeded** --> Click **Close** to close both the open windows for processing one after the other.

Step 10: Browse the Cube for Analysis

10.1 In Solution Explorer, right click on Cube Name (SalesDataAnalyticsCube) --> Click **Browse**

Business Intelligence LAB Manual

10.2 Drag and drop measures in to Detail fields, & Drag and Drop Dimension Attributes in Row Field or Column fields.

Now to **Browse Our Cube**

1. Product Name Drag & Drop into Column
2. Full Date UK Drag & Drop into Row Field
3. FactProductSalesCount Drop this measure in Detail area

A screenshot of Microsoft Visual Studio showing the 'SalesDataAnalysis' project. The 'Dim Data.dim [Design]' tab is selected. The 'Cube Browser' window is open, displaying a grid of sales data. Dimension attributes are mapped to the grid: 'Product Name' to the columns, 'Full Date UK' to the rows, and 'SalesAmount' to the 'Grand Total' column header. The 'Dimensions' pane on the left shows the hierarchy of dimensions used in the cube.

Business Intelligence LAB Manual

Practical 5: Apply the what – if Analysis for data visualization. Design and generate necessary reports based on the data warehouse data.

A book store and have 100 books in storage. You sell a certain % for the highest price of \$50 and a certain % for the lower price of \$20.

C8				
1	Book Store			
3	total number of books			% sold for the highest price
4	100		60%	
5				
6		number of books		unit profit
7	highest price		60	\$50
8	lower price		40	\$20
9				
10		total profit		\$3,800
11				

If you sell 60% for the highest price, cell D10 calculates a total profit of $60 * \$50 + 40 * \$20 = \$3800$.

Create Different Scenarios

THE NEXT LEVEL OF EDUCATION

But what if you sell 70% for the highest price? And what if you sell 80% for the highest price? Or 90%, or even 100%? Each different percentage is a different **scenario**. You can use the Scenario Manager to create these scenarios.

Note: You can simply type in a different percentage into cell C4 to see the corresponding result of a scenario in cell D10. However, what-if analysis enables you to easily compare the results of different scenarios. Read on.

1. On the Data tab, in the Forecast group, click What-If Analysis.

2. Click Scenario Manager.

Business Intelligence LAB Manual

The Scenario Manager dialog box appears.

3. Add a scenario by clicking on Add.

4. Type a name (60% highest), select cell C4 (% sold for the highest price) for the Changing cells and click on OK.

5. Enter the corresponding value 0.6 and click on OK again.

Business Intelligence LAB Manual

6. Next, add 4 other scenarios (70%, 80%, 90% and 100%).

Finally, your Scenario Manager should be consistent with the picture below:

Business Intelligence LAB Manual

Practical 6: Implementation of Classification algorithm in R Programming.

Consider the annual rainfall details at a place starting from January 2012. We create an R time series object for a period of 12 months and plot it.

```
# Get the data points in form of a R vector.  
rainfall <-  
c(799,1174.8,865.1,1334.6,635.4,918.5,685.5,998.6,784.2,985,882.8,1071)  
  
# Convert it to a time series object.  
rainfall.timeseries <- ts(rainfall,start = c(2012,1),frequency = 12)  
  
# Print the timeseries data.  
print(rainfall.timeseries)  
  
# Give the chart file a name.  
png(file = "rainfall.png")  
  
# Plot a graph of the time series.  
plot(rainfall.timeseries)  
  
# Save the file.  
dev.off()
```

Output:

When we execute the above code, it produces the following result and chart –

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2012	799.0	1174.8	865.1	1334.6	635.4	918.5	685.5	998.6	784.2			
	985.0	882.8	1071.0									

Business Intelligence LAB Manual

Business Intelligence LAB Manual

Practical 7: Practical Implementation of Decision Tree using R Tool

```
install.packages("party")
```

The package "party" has the function **ctree()** which is used to create and analyze decision tree.

Syntax

The basic syntax for creating a decision tree in R is –

```
ctree(formula, data)
```

Input Data

We will use the R in-built data set named **readingSkills** to create a decision tree. It describes the score of someone's readingSkills if we know the variables "age", "shoeSize", "score" and whether the person is a native speaker or not.

Here is the sample data.

```
# Load the party package. It will automatically load other  
# dependent packages.  
library(party)  
  
# Print some records from data set readingSkills.  
print(head(readingSkills))
```

When we execute the above code, it produces the following result and chart –

```
nativeSpeaker    age   shoeSize   score  
1   yes        5    24.83189  32.29385  
2   yes        6    25.95238  36.63105  
3   no         11   30.42170  49.60593  
4   yes        7    28.66450  40.28456  
5   yes        11   31.88207  55.46085  
6   yes        10   30.07843  52.83124  
Loading required package: methods  
Loading required package: grid  
.....  
.....
```

We will use the **ctree()** function to create the decision tree and see its graph.

```
# Load the party package. It will automatically load other  
# dependent packages.  
library(party)  
  
# Create the input data frame.  
input.dat <- readingSkills[c(1:105),]  
  
# Give the chart file a name.  
png(file = "decision_tree.png")  
  
# Create the tree.  
output.tree <- ctree(  
  nativeSpeaker ~ age + shoeSize + score,
```

Business Intelligence LAB Manual

```
data = input.dat)

# Plot the tree.
plot(output.tree)

# Save the file.
dev.off()
```

Output:-

```
null device
1
Loading required package: methods
Loading required package: grid
Loading required package: mvtnorm
Loading required package: modeltools
Loading required package: stats4
Loading required package: strucchange
Loading required package: zoo

Attaching package: 'zoo'

The following objects are masked from 'package:base' :

as.Date, as.Date.numeric
```

Loading required package: sandwich

Business Intelligence LAB Manual

Practical 8: k-means clustering using R

Compare the Species label with the clustering result

```
R R Console
> #Compare the Species label with the clustering result
> table (iris$Species,kc$cluster)

      1   2   3
setosa    0   0  50
versicolor 48   2   0
virginica  14  36   0
> |
```

Plot the clusters and their centre

```
R Console
```

```
> # Plot the clusters and their centers
> plot(newiris[c("Sepal.Length", "Sepal.Width")], col=kc$cluster)
> points(kc$centers[,c("Sepal.Length", "Sepal.Width")], col=1:3, pch=8, cex=2)
> |
```

Business Intelligence LAB Manual

Practical 9: Prediction Using Linear Regression

In Linear Regression these two variables are related through an equation, where exponent (power) of both these variables is 1. Mathematically a linear relationship represents a straight line when plotted as a graph. A non-linear relationship where the exponent of any variable is not equal to 1 creates a curve.

$y = ax + b$ is an equation for linear regression.

Where, y is the response variable, x is the predictor variable and a and b are constants which are called the coefficients.

A simple example of regression is predicting weight of a person when his height is known. To do this we need to have the relationship between height and weight of a person.

The steps to create the relationship is –

- Carry out the experiment of gathering a sample of observed values of height and corresponding weight.
- Create a relationship model using the **lm()** functions in R.
- Find the coefficients from the model created and create the mathematical equation using these
- Get a summary of the relationship model to know the average error in prediction. Also called **residuals**.
- To predict the weight of new persons, use the **predict()** function in R.

Input Data

Below is the sample data representing the observations –

```
# Values of height  
151, 174, 138, 186, 128, 136, 179, 163, 152, 131
```

```
# Values of weight.  
63, 81, 56, 91, 47, 57, 76, 72, 62, 48
```

lm() Function

This function creates the relationship model between the predictor and the response variable.

Syntax

The basic syntax for **lm()** function in linear regression is –

```
lm(formula,data)
```

Following is the description of the parameters used –

- **formula** is a symbol presenting the relation between x and y.
- **data** is the vector on which the formula will be applied.

Create Relationship Model & get the Coefficients

Business Intelligence LAB Manual

```
x <- c(151, 174, 138, 186, 128, 136, 179, 163, 152, 131)
y <- c(63, 81, 56, 91, 47, 57, 76, 72, 62, 48)

# Apply the lm() function.
relation <- lm(y~x)
```

print(relation)

When we execute the above code, it produces the following result –

Call:

```
lm(formula = y ~ x)
```

Coefficients:

	x
(Intercept)	-38.4551
x	0.6746

Get the Summary of the Relationship

```
x <- c(151, 174, 138, 186, 128, 136, 179, 163, 152, 131)
y <- c(63, 81, 56, 91, 47, 57, 76, 72, 62, 48)
```

```
# Apply the lm() function.
relation <- lm(y~x)
```

```
print(summary(relation))
```

When we execute the above code, it produces the following result –

call:

```
lm(formula = y ~ x)
```

Residuals:

Min	1Q	Median	3Q	Max
-6.3002	-1.6629	0.0412	1.8944	3.9775

Coefficients:

	Estimate	Std. Error	t value	Pr(> t)
(Intercept)	-38.45509	8.04901	-4.778	0.00139 **
x	0.67461	0.05191	12.997	1.16e-06 ***

Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

Residual standard error: 3.253 on 8 degrees of freedom

Multiple R-squared: 0.9548, Adjusted R-squared: 0.9491

F-statistic: 168.9 on 1 and 8 DF, p-value: 1.164e-06

predict() Function

Syntax

The basic syntax for predict() in linear regression is –

```
predict(object, newdata)
```

Following is the description of the parameters used –

- **object** is the formula which is already created using the lm() function.
- **newdata** is the vector containing the new value for predictor variable.

Business Intelligence LAB Manual

Predict the weight of new persons

```
# The predictor vector.  
x <- c(151, 174, 138, 186, 128, 136, 179, 163, 152, 131)  
  
# The response vector.  
y <- c(63, 81, 56, 91, 47, 57, 76, 72, 62, 48)  
  
# Apply the lm() function.  
relation <- lm(y~x)  
  
# Find weight of a person with height 170.  
a <- data.frame(x = 170)  
result <- predict(relation,a)  
print(result)  
  
Result:  
1  
76.22869
```

Visualize the Regression Graphically

```
# Create the predictor and response variable.  
x <- c(151, 174, 138, 186, 128, 136, 179, 163, 152, 131)  
y <- c(63, 81, 56, 91, 47, 57, 76, 72, 62, 48)  
relation <- lm(y~x)  
  
# Give the chart file a name.  
png(file = "linearregression.png")  
  
# Plot the chart.  
plot(y,x,col = "blue",main = "Height & Weight Regression",  
abline(lm(x~y)),cex = 1.3,pch = 16,xlab = "Weight in Kg",ylab = "Height in  
cm")  
  
# Save the file.  
dev.off()  
output:
```

Business Intelligence LAB Manual

Practical 10: Data Analysis using Time Series Analysis

Time series is a series of data points in which each data point is associated with a timestamp. A simple example is the price of a stock in the stock market at different points of time on a given day. Another example is the amount of rainfall in a region at different months of the year. R language uses many functions to create, manipulate and plot the time series data. The data for the time series is stored in an R object called **time-series object**. It is also a R data object like a vector or data frame.

The time series object is created by using the **ts()** function.

Syntax

The basic syntax for **ts()** function in time series analysis is –

```
timeseries.object.name <- ts(data, start, end, frequency)
```

Following is the description of the parameters used –

- **data** is a vector or matrix containing the values used in the time series.
- **start** specifies the start time for the first observation in time series.
- **end** specifies the end time for the last observation in time series.
- **frequency** specifies the number of observations per unit time.

Except the parameter "data" all other parameters are optional.

Example

Consider the annual rainfall details at a place starting from January 2012. We create an R time series object for a period of 12 months and plot it.

```
# Get the data points in form of a R vector.  
rainfall <-  
c(799,1174.8,865.1,1334.6,635.4,918.5,685.5,998.6,784.2,985,882.8,1071)  
  
# Convert it to a time series object.  
rainfall.timeseries <- ts(rainfall,start = c(2012,1),frequency = 12)  
  
# Print the timeseries data.  
print(rainfall.timeseries)  
  
# Give the chart file a name.  
png(file = "rainfall.png")  
  
# Plot a graph of the time series.  
plot(rainfall.timeseries)  
  
# Save the file.  
dev.off()
```

Business Intelligence LAB Manual

Output:-

Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	
2012	799.0	1174.8	865.1	1334.6	635.4	918.5	685.5	998.6	784.2
	Oct	Nov	Dec						
	2012	985.0	882.8	1071.0					

Business Intelligence LAB Manual

Practical 11: Data Modelling and Analytics with Pivot Table in Excel

Data Model is used for building a model where data from various sources can be combined by creating relationships among the data sources. A Data Model integrates the tables, enabling extensive analysis using PivotTables, Power Pivot, and Power View.

A **Data Model** is created automatically when you import two or more tables simultaneously from a database. The existing database relationships between those tables is used to create the Data Model in Excel.

Step 1 – Open a new blank Workbook in Excel.

Step 2 – Click on the **DATA** tab.

Step 3 – In the **Get External Data** group, click on the option **From Access**. The **Select Data Source** dialog box opens.

Step 4 – Select **Events.accdb**, Events Access Database file.

(url:/ <https://fcschools.instructure.com/courses/373/files/10607>)

Step 5 – The **Select Table** window, displaying all the **tables** found in the database, appears.

Business Intelligence LAB Manual

Step 6 – Tables in a database are similar to the tables in Excel. Check the ‘Enable selection of multiple tables’ box, and select all the tables. Then click **OK**.

Step 7 – The Import Data window appears. Select the **PivotTable Report** option. This option imports the tables into Excel and prepares a PivotTable for analyzing the imported tables. Notice that the checkbox at the bottom of the window - ‘Add this data to the Data Model’ is selected and disabled.

Business Intelligence LAB Manual

Step 8 – The data is imported, and a **PivotTable** is created using the imported tables.

Explore Data Using PivotTable

Step 1 – You know how to add fields to PivotTable and drag fields across areas. Even if you are not sure of the final report that you want, you can play with the data and choose the best-suited report.

In **PivotTable Fields**, click on the arrow beside the table - **Medals** to expand it to show the fields in that table. Drag the **NOC_CountryRegion** field in the **Medals** table to the **COLUMNS** area.

Step 2 – Drag **Discipline** from the **Disciplines** table to the **ROWS** area.

Business Intelligence LAB Manual

Step 3 – Filter Discipline to display only five sports: Archery, Diving, Fencing, Figure Skating, and Speed Skating. This can be done either in **PivotTable Fields** area, or from the **Row Labels** filter in the PivotTable itself.

Step 4 – In PivotTable Fields, from the **Medals** table, drag Medal to the **VALUES** area.

Step 5 – From the Medals table, select **Medal** again and drag it into the **FILTERS** area.

The screenshot shows a Microsoft Excel spreadsheet with a PivotTable. The PivotTable is located in the range A3:A14. The 'Medal' field is in the Values area, and the 'Discipline' field is in the Row Labels area. The PivotTable displays the count of medals for various sports: Archery, Diving, Fencing, Figure Skating, and Speed Skating. The data includes counts for each sport across different countries. A large watermark 'E-next' is overlaid on the bottom right of the image.

Step 6 – Click the dropdown list button to the right of the **Column labels.**

Step 7 – Select Value Filters and then select **Greater Than...**

Step 8 – Click OK.

The screenshot shows the 'Value Filters' dialog box for the PivotTable. The 'Greater Than...' option is selected in the list. The dialog box also shows other filter options like 'Select all', 'Equal To...', 'Not Equal To...', etc. A large watermark 'E-next' is overlaid on the bottom right.

The Value Filters dialog box for the count of Medals is greater than appears.

Business Intelligence LAB Manual

Step 9 – Type 80 in the Right Field.

Step 10 – Click OK.

The screenshot shows a Microsoft Excel spreadsheet titled "Data.xlsx - Excel". The PivotTable is currently set to show data for all countries ("All"). A context menu is open over the PivotTable, specifically on the "Value Filter" option under the "PivotTable Tools" ribbon. A "Value Filter (PVC_CountryRegion)" dialog box is displayed, prompting the user to enter a value for the filter. The input field contains "Type 80". The main PivotTable data is visible below, showing medal counts for various sports across different countries. The PivotTable structure includes columns for Medal, Sport, and Region, with data points such as Archery (32), Diving (13), Fencing (44), Figure skating (28), Speed skating (20), and a Grand Total of 320.

The PivotTable displays only those regions, which has more than total 80 medals.

This screenshot shows the same Microsoft Excel spreadsheet after applying the filter. The PivotTable now only displays data for regions with a total number of medals greater than 80. The visible data includes Archery (32), Diving (13), Fencing (44), Figure skating (28), Speed skating (20), and a Grand Total of 270. The PivotTable interface shows the "PivotTable" tab selected in the ribbon, and the "Value Filter" option is highlighted in the context menu. The overall title of the spreadsheet is "Data.xlsx - Excel".

Create Relationship between Tables

Relationships let you analyze your collections of the data in Excel, and create interesting and aesthetic reports from the data you import.

Step 1 – Insert a new Worksheet.

Step 2 – Create a new table with new data. Name the new table as Sports.

Business Intelligence LAB Manual

The screenshot shows a Microsoft Excel spreadsheet. At the top, the ribbon tabs are visible: FILE, HOME, INSERT, PAGE LAYOUT, FORMULAS, DATA, REVIEW, VIEW, PIVOTCHARTS, POWERPIVOT, and ANALYSE. The 'DATA' tab is selected. The main area contains a table titled 'New Data Table' with 23 rows and 2 columns. The first column lists sports disciplines, and the second column lists their corresponding values. A horizontal line labeled 'New Data Table' points to the table. Below the table, another horizontal line labeled 'New Worksheet' points to the tab bar where 'Sheet2' is selected. The status bar at the bottom right shows '2011 (1)'.

Discipline	Value
1 Aquatics	55
2 Archery	52
3 Athletics	53
4 Badminton	54
5 Baseball	55
6 Basketball	56
7 Basque Pelota	57
8 Biathlon	58
9 Bocce	59
10 Boxing	59
11 Canoe / Kayak	59
12 Cricket	59
13 Croquet	59
14 Curling	59
15 Cycling	59
16 Equestrian	59
17 Fencing	59
18 Football	59
19 Golf	59
20 Gymnastics	59
21 Handball	59
22 Hockey	59
23 Judo	59

Step 3 – Now you can create relationship between this new table and the other tables that already exist in the **Data Model** in Excel. Rename the Sheet1 as **Medals** and Sheet2 as **Sports**.

On the **Medals** sheet, in the **PivotTable Fields List**, click **All**. A complete list of available tables will be displayed. The newly added table - **Sports** will also be displayed.

The screenshot shows a Microsoft Excel spreadsheet with a PivotTable. The PivotTable Fields List is open on the right side of the screen, showing a tree view of available fields. The 'ACTIVE: ALL' node is expanded, revealing 'Disciplines', 'Medals', 'Events', and 'Teams'. The 'Disciplines' node is selected. The PivotTable itself displays a count of medals for various disciplines across different countries. The status bar at the bottom right shows '2011 (1)'.

Discipline	CAN	CHN	FRA	GER	HUN	IRL	MED	NOR	POK	RUS	UKR	USA	Grand Total
Archery	51	15	46	8	12	9	4	1	3	32	203	274	
Driving		11	60	1	24	0			26	34	131		
Fencing	48	13	263	51	226	328	24	61	41	145	48	1250	
Figure skating	2	29	7	18	11	12	3	1	7	29	42	53	
Speed skating	1	41	19	44	7	79	70	2	8	80	72	403	
Grand Total	99	82	320	548	126	258	958	115	86	87	101	268	355

Step 4 – Click on **Sports**. In the expanded list of fields, select **Sports**. Excel messages you to create a relationship between tables.

Business Intelligence LAB Manual

The screenshot shows a Microsoft Excel interface with a PivotTable Fields pane open on the right. A message box with the title 'Message to Create Relationships Between Tables' has an arrow pointing to the 'CREATE...' button in the 'Relationships' section of the pane. The pane lists tables like 'Sports', 'Events', and 'Teams'. The main worksheet displays a PivotTable with columns for CAN, CHN, FRA, GER, HUN, ITA, NED, NOR, POL, RUS, URSS, USA, and Grand Total.

Step 5 – Click on CREATE. The Create Relationship dialog box opens.

The screenshot shows the 'Create Relationship' dialog box in Microsoft Excel. A large watermark 'E-NEXT LEVEL OF EDUCATION' is overlaid on the screen. The dialog box has 'Disciplines' selected in the 'Table' dropdown and 'SportID' selected in the 'Column (Foreign)' dropdown. The 'Related Column (Primary)' dropdown shows 'SportID' selected. The main worksheet shows a PivotTable with various sports disciplines and their medal counts.

Step 6 – To create the relationship, one of the tables must have a column of unique, non-repeated, values. In the **Disciplines table, **SportID** column has such values. The table **Sports** that we have created also has the **SportID** column. In **Table**, select **Disciplines**.**

Step 7 – In Column (Foreign), select SportID.

Step 8 – In Related Table, select Sports.

Step 9 – In Related Column (Primary), SportID gets selected automatically. Click OK.

Step 10 – The PivotTable is modified to reflect the addition of the new Data Field Sport. Adjust the order of the fields in the Rows area to maintain the Hierarchy. In this case, Sport

Business Intelligence LAB Manual

should be first and **Discipline** should be the next, as **Discipline** will be nested in Sport as a sub-category.

PivotTable with the New Relationship

Rows ordered for proper Hierarchy

	CAN	CHN	FRA	GER	HUN	ITA	NED	NOR	POL	RUS	URS	USA	Grand Total
Aquatics	11	60	1	28	9		24	14	33				274
Diving	13	80	1	24	8		24	14	22				274
Archery	51	19	46	8	32	9	6	1	2	52			261
Artistry	34	15	48	8	32	9	4	1	2	52			261
Fencing	44	19	281	53	236	220	24	63	43	145	48		1296
Fencing	44	19	281	53	236	220	24	63	43	145	48		1296
Skating	4	71	26	18	45	52	9	28	86	2	37	352	538

Business Intelligence LAB Manual

Practical 12: Data Analysis and Visualization using Advanced Excel

Power View is a feature of Microsoft Excel 2013 that enables **interactive** data exploration, visualization, and presentation encouraging intuitive ad-hoc reporting.

Create a Power View Sheet

Make sure **Power View** add-in is enabled in Excel 2013.

Step 1 – Click on the **File** menu and then Click on **Options**.

The **Excel Options** window appears.

Step 2 – Click on **Add-Ins**.

Step 3 – In the **Manage** box, click the drop-down arrow and select **Excel Add-ins**.

Step 4 – All the available **Add-ins** will be displayed. If **Power View** Add-in is enabled, it appears in Active Application Add-ins.

Business Intelligence LAB Manual

If it does not appear, follow these steps –

Step 1 – In the **Excel Options** Window, Click on **Add-Ins**.

Step 2 – In the **Manage** box, click the drop-down arrow and select **COM Add-ins**

Step 3 – Click on the **Go** button. A **COM Add-Ins** Dialog Box appears.

Step 4 – Check the **Power View** Check Box.

Step 5 – Click **OK**.

THE NEXT LEVEL OF EDUCATION

Now, you are ready to create the **Power View** sheet.

Step 1 – Click on the **Data Table**.

Business Intelligence LAB Manual

Step 2 – Click on **Insert** tab.

Step 3 – Click on **Power View** in Reports Group.

An **Opening Power View** window opens, showing the progress of Working on opening Power View sheet.

The **Power View sheet** is created for you and added to your Workbook with the **Power View**. On the Right-side of the **Power View**, you find the **Power View Fields**. Under the **Power View Fields** you will find **Areas**.

In the Ribbon, if you click on **Design tab**, you will find various **Visualization** options.

Business Intelligence LAB Manual

Create Charts and other Visualizations

For every visualization you want to create, you start on a Power View sheet by creating a table, which you then easily convert to other visualizations, to find one that best illustrates your Data.

Step 1 – Under the **Power View Fields**, select the fields you want to visualize.

Step 2 – By default, the **Table** View will be displayed. As you move across the Table, on the top-right corner, you find two symbols – **Filters** and **Pop out**.

Step 3 – Click on the **Filters** symbol. The filters will be displayed on the right side. **Filters** has two tabs. **View** tab to filter all visualizations in this **View** and **Table** tab to filter the specific values in this table only.

Business Intelligence LAB Manual

Visualization – Matrix

A **Matrix** is made up of rows and columns like a **Table**. However, a Matrix has the following capabilities that a Table does not have –

- Display data without repeating values.
- Display totals and subtotals by row and column.
- With a hierarchy, you can drill up/drill down.

Collapse and Expand the Display

Step 1 – Click on the **DESIGN** tab.

Step 2 – Click on **Table** in the **Switch Visualization Group**.

Step 3 – Click on **Matrix**.

The **Matrix Visualization** appears.

Business Intelligence LAB Manual

The screenshot shows the Microsoft Power BI interface. On the left, there is a matrix visualization titled "Hosts" with data grouped by "City" and "Edition". The matrix contains values for "Summer" and "Winter" seasons. On the right, the "Power View Fields" pane is open, showing fields like "Alpha-2-Codes", "City", "Edition", "EditionID", "NDC_CountryRegion", and "Session". The "ROWS" section is set to "City" and "NDC_CountryRegion", and the "VALUES" section is set to "Session".

Visualization – Card

You can convert a **Table** to a series of **Cards** that display the data from **each row** in the table laid out in a **Card format**, like an **index Card**.

Step 1 – Click on the **DESIGN** tab.

Step 2 – Click on **Table** in the **Switch Visualization Group**.

Step 3 – Click on **Card**.

The screenshot shows the Microsoft Power BI interface with the "Design" tab selected. In the "Switch Visualization Group", the "Card" option is highlighted. The main area displays a card visualization titled "Hosts" with data from a table. The "Power View Fields" pane on the right is identical to the previous screenshot, showing fields for Alpha-2-Codes, City, Edition, EditionID, NDC_CountryRegion, and Session.

The **Card Visualization** appears.

Business Intelligence LAB Manual

The screenshot shows a Microsoft Power BI interface. On the left, there's a ribbon with tabs like File, Home, Insert, Page Layout, Formulas, Data, View, Forecast, Design, Report, and Power View. Below the ribbon, there are buttons for Tables, Bar, Column, Other, Map, Chart, Chart+, Chart+, and Card Visualization. The main area displays a 'Card Visualization' titled 'Hosts'. This visualization lists various hosts with their names, cities, and medal counts: Italy (1992 Summer), Spain (1992 Summer), Germany (1992 Summer), Australia (1992 Summer), New Zealand (1992 Summer), South Africa (1992 Summer), United States (1992 Summer), France (1992 Summer), Mexico (1992 Summer), and Argentina (1992 Summer). To the right of the visualization is a 'Power View Fields' pane. At the bottom right, there's a 'Report Fields' pane.

Visualization – Charts

In **Power View**, you have a number of Chart options: Pie, Column, Bar, Line, Scatter, and Bubble. You can use several design options in a chart such as showing and hiding labels, legends, and titles.

Charts are interactive. If you click on a Value in one Chart –

- the **Value** in that chart is highlighted.
- All the Tables, Matrices, and Tiles in the report are filtered to that Value.
- That **Value** in all the other Charts in the report is highlighted.

The charts are interactive in a presentation setting also.

Step 1 – Create a **Table Visualization** from **Medals** data.

You can use Line, Bar and Column Charts for comparing data points in one or more data series. In these Charts, the x-axis displays one field and the y-axis displays another, making it easy to see the relationship between the two values for all the items in the Chart.

Line Charts distribute category data evenly along a horizontal (category) axis, and all numerical value data along a vertical (value) axis.

Step 2 – Create a Table Visualization for two Columns, **NOC_CountryRegion** and **Count of Medal**.

Step 3 – Create the same Table Visualization below.

Business Intelligence LAB Manual

Step 4 – Click on the **Table Visualization** below.

Step 5 – Click on **Other Chart** in the **Switch Visualization** group.

Step 6 – Click on **Line**.

The **Table Visualization** converts into **Line Chart Visualization**.

Business Intelligence LAB Manual

In a **Bar Chart**, categories are organized along the vertical axis and values along the horizontal axis. In **Power View**, there are three subtypes of the **Bar Chart**: **Stacked**, **100% stacked**, and **Clustered**.

Step 7 – Click on the Line Chart Visualization.

Step 8 – Click on Bar Chart in the Switch Visualization Group.

Step 9 – Click on the Stacked Bar option.

The **Line Chart Visualization** converts into **Stacked Bar Chart Visualization**.

Business Intelligence LAB Manual

Step 10 – In the Power View Fields, in the Medals Table, select the Field Gender also.

Step 11 – Click on one of the bars. That portion of the bar is highlighted. Only the row containing the Data specific to the selected bar is displayed in the table above.

Business Intelligence LAB Manual

You can use the column charts for showing data changes over a period of time or for illustrating comparison among different items. In a Column Chart, the categories are along the horizontal axis and values are along the vertical axis.

In Power View, there are three **Column Chart** subtypes: **Stacked**, **100% stacked**, and **Clustered**.

Step 12 – Click on the **Stacked Bar Chart Visualization**.

Step 13 – Click on Column Chart in the **Switch Visualization** group.

Step 14 – Click on **Stacked Column**.

The **Stacked Bar Chart Visualization** converts into **Stacked Column Chart Visualization**.

Business Intelligence LAB Manual

You can have simple **Pie Chart Visualizations** in Power View.

Step 1 – Click on the **Table Visualization** as shown below.

Step 2 – Click on **Other Chart** in the **Switch Visualization** group.

Step 3 – Click on **Pie** as shown in the image given below.
